Alerting Abstract US A1

NOVELTY - A resource allocation server automatically allocates several resources based on data associated with the resources. The data includes instance data and dynamically modifiable metadata.

DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

- 1.Resource allocation method;
- 2.Data packet; and
- 3.Computer readable medium storing resource allocation program.

USE - For allocating resources for web-based services.

ADVANTAGE - Allocates resources to consumers easily and quickly

DESCRIPTION OF DRAWINGS - The figure shows the block diagram of the resources allocation system.

Title Terms/Index Terms/Additional Words: RESOURCE; ALLOCATE; SYSTEM; WEB; BASED; SERVICE; DATA; ASSOCIATE; INSTANCE; DYNAMIC; MODIFIED

Alerting Abstract EP A2

The general editing apparatus is additionally equipped with a display manager, a device for managing related portions between the first kind of data and a second kind of data, and a device for managing related portions in the second kind of data.

The related portions to be simultaneously referred to and updated are automatically managed and updated regardless of the different data formats.

USE/ADVANTAGE - Wordprocessing or spread sheet programs, DTP. Editing performed by smaller number of operations.

Equivalent Alerting Abstract US A

Data is simultaneously edited by receiving an edit a content of command to edit a portion of the first kind of data e.g. text through the editing input. The portion of the first kind of data stored in the memory is updated in response to the edit command. A related portion of a second kind of data which is related to the portion of the first kind of data is determined and is simultaneously updated with the **updating** of the **portion** of the first kind of **data** in accordance with the edit command to edit the first kind of data. The second kind of **data** is graphic **data** including bit map expressed character codes.

The edit command requests an update of a text string in the first kind of data, and the related portion of the second kind of data is a portion of the bit map expressed character codes in the graphic data representing a same phrase as the text string in the first kind of data requested for the update by the edit command. The simultaneously updating includes updating the same phase in the graphic data to reflect a same change as is carried out by the update of the text string in the first kind of data.

ADVANTAGE - Simultaneously retrieves and edits number of kinds of data.

ABSTRACT

PROBLEM TO BE SOLVED: To provide an information presenting environment, which is kind for a user and has a high degree of freedom, by presenting **information** on a presentation **part** while automatically **adding** its **updating** conditions.

SOLUTION: When presenting **information** **linked** with the other **information** for presenting **information** distributed on a network, the information to be presented is read by a reading part 11 and the read information is locally stored in a storage part 12. At an interpretation part 13, the information read from the reading part 11 is interpreted and the other **information**, which is interpreted as the extension **linked information** in that process, is read by a comparative information reading part 14. A comparator part 15 compares the old information stored in the storage part 12 with the current information read by the comparative information reading part 14. Based on the **information** on the compared result, at a **reflection** part 16, a method for reflection on presentation contents is determined, and the presentation information is prepared by the interpretation part 13. Thus, at a presentation **part**, the **information** is presented while **automatically adding** its **updating** conditions.

ABSTRACT

PURPOSE: To automatically collect data by adding link information ,
by which the part of a document having meaning contents corresponding
to a keyword is made correspondent to the keyword, to a document.

CONSTITUTION: In the part of the document, the link information is
added so as to make the part of the document having the meaning contents
corresponding to each keyword correspondent to the keyword. Therefore, when
a user designates the keyword concerning the desired information to obtain
the information, it is possible to extract the part of the document having
the meaning contents corresponding to the keyword from the inside of the
document. Further, the user of the information processor stores the
keyword, which is designated concerning the desired item to acquire the
information , in the information processor and extracts the part of the
document having the meaning contents corresponding to the designated
keyword from the plural documents transmitted through an information
network or various information media. Then, this is stored and accumulated.
Thus, the data can be automatically collected.

ABSTRACT

PURPOSE: To reduce the working load of an operator by providing a data attribute process control part which decides the processing method of the input data by referring to an identification **information** store table storing the **relation** between the data attribute **information** and the process information and then processes the input data.

CONSTITUTION: A **data** attribute identification **information** detecting part detects **automatically** the symbol added to the head or the end of the input data, a specific character string included in the input data, or the classification of the input **data** as the **data** attribute **information**. An identification **information** store table stores the process information and the data input field position information serving as the data attribute information, the data process formula information, the data transfer destination **information**, the data delivery destination **information**, or the **relation** with the data store address **information**. Then a data attribute process control part refers to the identification **information** store table to retrieve the process **information** corresponding to the data attribute **information** detected at the data attribute identification information detecting part and carries out a due process based on the obtained process information. Thus it is possible to designate the data processing method concurrently with the input of data.

Alerting Abstract EP A1

The device comprises an input for receiving the information signals to be recorded and includes recording unit for recording received main information signals together with additional information on the record carrier. The device also has a signal presence detector which senses the presence of information signals to be recorded on the basis of the input information. An adaptor unit causes the additional information to be modified w.r.t a detection that, at least during a first set time interval, an interruption of the presence of the information has been detected.

A terminating device stops the recording in response to a detection that, at least for a set second time interval which is longer than the first, the presence of the information has not been detected.

USE/ADVANTAGE - Compact disc data recording . Allows subcode to always have correct relation with recorded information with reduced attention from user.

Equivalent Alerting Abstract US A

The recording device comprises a controller for generating auxiliary information to be associated with a received information signal during recording, the auxiliary information being adapted in relationship to the associated information signal. A recorder is coupled to the input and to the controller for converting each received information signal and the

associated auxiliary information into a recording signal for controlling a write head to record the record carrier in accordance with the recording signal.

A signal presence detector is coupled to the input for detecting whether a presently received information signal is valid for recording and is received at least a first predetermined time interval (T3) after a last previous information signal which was valid for recording, and in that event to supply a control signal to the controller to cause it to adapt the auxiliary information generated thereby so as to relate to the presently received information signal.

ADVANTAGE - Requirers less attention on part of user.

ABSTRACT

PROBLEM TO BE SOLVED: To obtain an information converting method, etc., for efficiently converting audio information supplied, based on predetermined specifications into transmission information to be transmitted through a data bus based on predetermined specifications.

SOLUTION: The method for converting audio information based on the DVD Audio Standards into transmission information based on the IEEE 1394 Standard comprises extracting reproduction control information contained in a private heater, grouping the audio information in packets to form audio data AD1-AD6, and adding the reproduction control information such as dynamic range control data DRC following the audio data AD1-AD6, thereby forming isochronous packets IP.

ABSTRACT EP 1630701 A1

A system and a method for managing information encapsulates the
information as objects (34). The objects (34) are related by a degree to
other objects (34) in a content network (40). The relationships (42)
between the objects (34) may be established and enhanced by various
means, including combining fuzzy object subsets (34c, 34t), establishing
subsets and applying access control, and/or applying edit cascading
control to a subset. An attractive user interface (14) facilitates use
and management of the network (40) by many users. Access to the content
network (40) may be customized for distinct user groups.

...SPECIFICATION divided from our European patent application no.

EP-A-1,311,980.

Background

This invention **relates** to storage and management of information and, more particularly, to a fuzzy set-based architecture...

- ...and so on. Often, a hierarchical structure is established for storing the information, but the **relationship** between the data items is not effectively catalogued. Further, incompatibility between file formats often frustrates...
- ...a flat file structure. The files are often "related" in a tree hierarchy, but the **relationships** provide very limited **information** on context of the files. The most sophisticated search engines are powerless to provide truly...
- ...link may have a weighting that represents the strength of the relationship, represented by a " **link** object". The documents or multimedia may be **described** as "node objects" in a network, and the documents or multimedia may have **associated descriptive** attributes, such as title, author, and key words ("node descriptors"). Further, some of these objects may not contain information or references to **information** per se, but may have **associated** attributes and relationships with other objects (these types of objects are termed "semantic objects"). Establishing...
- ...enabling certain modifications to the object network, are also described.
Wiesener S., et al, further **describe** a particular method of automatically creating **links** within the object network. These links are termed "virtual edge objects". The links are generated...
- ...Automatic generation of relationships ("virtual edges") are based only on the attributes of the meta- **information** of objects (and are restricted to **connecting** "semantic objects" with non-semantic objects). Automatically created relationships between semantic and non-semantic objects...
- ...the content network further may be customized for distinct user groups.

Fuzzy Set Theory

The **relational** database paradigm, as first **described** by Codd in 1970, employs a generalized, abstract mathematical model (based on classical set theory...

ABSTRACT EP 1022901 A1

An information server for providing information in an output transport
stream, the information server comprising an API server for receiving
control and data from an external host controller, a storage for storing
at least said data, at least one stream generator for assembling
transport stream packets from said data under the control of the API
server.

SPECIFICATION The present invention **relates** to an information server for providing information in an output transport stream, more particularly to ...

...it is possible to change the driver with which the information server is used without **changing** any other **part** of the **information** server.

The present invention will be more clearly understood from the following description, given by...

...Figure 7 illustrates the construction of DVB sections from files; and

Figure 8 illustrates a **dependency** structure for data transformations.

The following **description** **relates** to an **Information** Server to which the present invention may be applied. In particular, an architecture is proposed...

...of generating DVB compliant transport streams containing DSMCC Data and Object Carousels. In addition, the **Information** Server is to support the **dynamic updating** of content inside a DSMCC Data and Object Carousel while it is being streamed out...
